Flame Tracker*  

**Flame Tracker improves performance and availability of your gas turbine**

### Designed for Peak Performance and Reliability

GE’s Silicon Carbide (SiC) Flame Tracker dramatically improves gas turbine performance while significantly reducing maintenance requirements. Standard on all new GE gas turbines, the Flame Tracker flame sensor’s optical photodiode is designed for use with multiple fuels, low NO\textsubscript{x} combustors and steam injection. Reliable turbine operations for oil/steam injection applications require the sensitivity provided by Flame Tracker.

### Advantages

**High Sensitivity, Fast Response**

Flame Tracker, with its patented SiC photodiode, has high sensitivity to the longer UV wavelengths that easily penetrates the fog of fuel and steam. This is advantageous over typical flame sensors that are sensitive to only the short UV wavelengths. In addition, the SiC sensor has an analog output with a very wide dynamic range and rapid response time. These features offer the ability to quickly—in less than 25 milliseconds—track flame dynamics, including flameout. This means interruption-free service and improved availability.

**Reduced Maintenance**

The Flame Tracker flame sensor is equipped with quick disconnect connectors, allowing sensor replacement time to be reduced from hours to minutes. Its improved sensor-cooling feature lowers the impact of surrounding heat and extends the life of electronics.

**Customized Conversion Kits**

GE supplies customized flame sensor conversion kits for all turbine configurations. These sensor enhancements are mechanically and electrically interchangeable with existing systems. The kit solution simplifies upgrading older, maintenance-intensive systems to the superior performance of GE’s Flame Tracker.

**Multiple Applications**

Designed to replace existing sensors, the Flame Tracker is applicable to all land-based and marine-based gas turbines, regardless of size. In addition, it is internationally approved for UL and CE applications.

### Reliable, Low Voltage Operation

Providing a 4–20 mA industry-standard output signal, the Flame Tracker operates reliably with any fuel—with or without steam injection. Unlike older flame sensors that require high voltage for operation, the Flame Tracker requires low voltage, which eliminates special wiring and explosion-proof conduit requirements.

### Performance Benefits

- Provides reliable operation when using any fuel
- Eliminates signal flicker
- Allows full operation during the water wash cycle
- Reduces maintenance time
- Operates on low voltage
- Provides rapid response to flameout
- Produces a wide dynamic range
- Offers easy, customized conversion option
- Customized conversion kits
- Meets all NFPA guidelines for flame detection on gas turbines
- Delivers 10 times the sensitivity of tube-style sensors
Flame Emission

GE SiC Flame Detector
Optical and electrical characteristics closely match flame emissions UV

GM (Geiger-Muller) Tube
Peak sensitivity is at 190 nm, while flame intensity peak is 310 nm

Specifications

**Operating**

<table>
<thead>
<tr>
<th>Specification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Power Requirements</strong></td>
<td>24 VDC nominal, 12–30 VDC @ 100 mA</td>
</tr>
<tr>
<td><strong>Output</strong></td>
<td>4–20 mA (a module to convert output to other controller inputs is available)</td>
</tr>
<tr>
<td><strong>Response Time</strong></td>
<td>&lt;25 milliseconds</td>
</tr>
<tr>
<td><strong>Temperature Range</strong></td>
<td>-20°F to +300°F (-30°C to +150°C) 455°F (235°C) with specified water or air cooling</td>
</tr>
<tr>
<td><strong>Process Pressure</strong></td>
<td>To 400 psig (2.8 MPa)</td>
</tr>
<tr>
<td><strong>Sensitivity</strong></td>
<td>5 mA @ 1x10^{10} photons/in²/sec. @ 310 nm</td>
</tr>
</tbody>
</table>

**Material**

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
